Surgical and other procedures that cause pain or discomfort in animals must be performed under general anesthesia. General anesthesia is also useful as a method of restraint for procedures that if performed without anesthesia would cause excessive stress for the animal and/or expose the human handler to potential hazards.

At NHGRI, the most commonly used injectable anesthetics for mice are tribromoethanol, pentobarbital and a ketamine/xylazine mixture. Since tribromoethanol, known by its European brand name Avertin, is not commercially available in the U.S., it is prepared in the laboratory. This requires strict aseptic technique and special storage considerations.
