Ladder logic (also known as ladder diagram or LD) is a programming language used to program a PLC (Programmable Logic Controller). It is a graphical PLC programming language which expresses logic operations with symbolic notation. Ladder logic is made out of rungs of logic, forming what looks like a ladder – hence the name 'Ladder Logic'.

B.R. Mehta, Y.J. Reddy, in Industrial Process Automation Systems, 2015. Ladder diagram. Ladder logic is a programming language that represents a program by a graphical diagram based on the circuit diagrams of relay logic hardware. It is primarily used to develop software for PLCs used in industrial control applications.

### Ladder Logic - an overview | ScienceDirect Topics

Ladder logic is widely used to program PLCs, where sequential control of a process or manufacturing operation is required. Ladder logic is useful for simple but critical control systems or for reworking old hardwired relay circuits. As programmable logic controllers became more sophisticated it has also been used in very complex automation systems.

§ 8.3 Soundness and completeness In this course, we are mainly interested in developing a system of logic that we can use to prove the validity of valid arguments, and demonstrate the invalidity of invalid arguments. In more advanced logic courses, the attention turns to proving things about the system of logic itself—this is
