This Monte Carlo simulation tool provides a means to test long term expected portfolio growth and portfolio survival based on withdrawals, e.g., testing whether the portfolio can sustain the planned withdrawals required for retirement or by an endowment fund. The following simulation models are supported for portfolio returns:

### Monte Carlo Simulation - Portfolio Visualizer

Monte Carlo simulation produces distributions of possible outcome values. By using probability distributions, variables can have different probabilities of different outcomes occurring. Probability distributions are a much more realistic way of describing uncertainty in variables of a risk analysis. Common probability distributions include:

### Creating a Monte Carlo Simulation Using Excel

Monte Carlo Simulations is a free software which uses Monte Carlo method (PERT based) to compute a project's time. You can add various activities and then estimate project time. To add activities, you can enter description, precedences, distributions (Uniform, Triangular, Beta, Gaussian, and Exponential), parameters, and critical path node.
