### Hydrophobic Interaction and Reversed Phase Chromatography

1 In general, each type of chromatography is comprised of two distinct 2 steps: chromatography (or separation of individual compounds in distinct elution 3 bands) and identification (detection of each elution band). Gas chromatography 4 is the process of taking a sample and injecting it into the instrument, turning the

chromatography, technique for separating the components, or solutes, of a mixture on the basis of the relative amounts of each solute distributed between a moving fluid stream, called the mobile phase, and a contiguous stationary phase. The mobile phase may be either a liquid or a gas, while the stationary phase is either a solid or a liquid.

### Basics of chromatographic Techniques Course 1

The basic principle of displacement chromatography is, "A molecule with a high affinity for the chromatography matrix (the displacer) will compete effectively for binding sites, and thus displace all molecules with lesser affinities".[17] There are distinct differences between displacement and elution chromatography. In

### Handbook of Advanced Chromatography/Mass Spectrometry ...

Chromatography is a physical method of separation that distributes components to separate between two phases, one stationary (stationary phase), the other (the mobile phase) moving in a definite direction. The eluate is the mobile phase leaving the column. This is also called effluent. The eluent is the solvent that carries the analyte.
